

Name: Amolik Sakshi Ravindra

College Name: PRAVARA RUARAL ENGINEERING COLLEGE LONI

Year: second year (SE)

Branch: instrumentation and control engineering

1. Combine Random Adjectives and Nouns

Start by defining two lists: one for adjectives and another for nouns. Use Python's `random.choice()` to randomly combine them.

```
import random

adjectives = ["Cool", "Happy", "Brave", "Fierce", "Silly", "Kind"]
nouns = ["Tiger", "Dragon", "Wolf", "Eagle", "Panda", "Fox"]

def generate_username():
    adjective = random.choice(adjectives)
    noun = random.choice(nouns)
    return adjective + noun
```

2. Add Customization Options

Allow users to specify if they want to include numbers, special characters, or set a specific length.

```
def generate_custom_username(add_numbers=True, add_special=True, length=None):
    username = generate_username()

    if add_numbers:
        username += str(random.randint(0, 999))

    if add_special:
        username += random.choice("!@#$%^&*")
```

```
if length and len(username) > length:
    username = username[:length]
return username
```

3. Save Usernames to a File

Save the generated usernames to a text file using Python's `open()` function.

```
def save_usernames_to_file(usernames, filename="usernames.txt"):
    with open(filename, "w") as file:
        for username in usernames:
            file.write(username + "\n")
```

4. Interactive User Input

Create a user-friendly CLI for input preferences.

```
def main():
    print("Welcome to the Username Generator!")
    num_usernames = int(input("How many usernames would you like to generate? "))
    add_numbers = input("Include numbers? (yes/no): ").strip().lower() == "yes"
    add_special = input("Include special characters? (yes/no): ").strip().lower() == "yes"
```

```
length = input("Set a maximum length? (Enter a number or press Enter to skip): ")
```

```
length = int(length) if length.isdigit() else None
```

```
usernames = [
```

```
    generate_custom_username(add_numbers, add_special, length)
```

```
    for _ in range(num_usernames)
```

```
]
```

```
print("\nGenerated Usernames:")
```

```
for username in usernames:
```

```
    print(username)
```

```
save_option = input("\nSave these usernames to a file? (yes/no): ").strip().lower()
```

```
if save_option == "yes":
```

```
    save_usernames_to_file(usernames)
```

```
    print("Usernames saved to 'usernames.txt'.")
```

```
if __name__ == "__main__":
```

```
    main()
```
